WFS Forest Auditing System as applied to proposed illegal logging of a Powerful Owl POMA.

Powerful Owl Management Ares near Bullarto had a logging coupe scheduled by DNRE. WFS challenged the legality of this logging based on the requirements in a POMA for there to be the following forest age classes etc-

> *In Victoria during the late 1990s, the establishment and selection criteria for **Powerful Owl Management Areas (POMAs)** were formalized under the Flora and Fauna Guarantee Act 1988 and integrated into Regional Forest Agreements (RFAs) and Forest Management Plans (such as the 1995 East Gippsland FMP). [1, 2, 3]*
>
> *The forest **age class and structural criteria** required for a reserve to be designated as a POMA included:*
>
> - ***Old-Growth and Mature Age Classes:** Forest stands selected for POMAs were strictly required to consist primarily of **old-growth (150+ to 200+ years old)** or **mature successional age classes**. The specific aim was to capture and retain patches of the oldest available age class within the forest management area. [1, 2, 3, 4, 5]*
> - ***Hollow-Bearing Tree Density:** The selected age class had to feature an abundance of senescent or mature eucalypts capable of providing large tree hollows. Criteria dictated that these hollows must be large enough to serve as owl nesting sites and sufficient to support populations of arboreal prey (e.g., Greater Gliders and Ringtail Possums). [1, 2, 3, 4]*
> - ***Size and Contiguity:** The age class criteria could not be met by isolated trees; instead, they had to form a **contiguous patch of forest of at least 500 hectares**. In areas subject to selective harvesting rather than clear-felling, the target size increased to Special Management Zones of up to **1,000 hectares** to guarantee adequate older forest structural components remained intact. [1, 2]*

The Wombat Forest Society, based on local knowledge felt the logging was noy legal as there had been a lot of area logged in the POMA, prior to this coupe.

Loris had developed a comprehensive logging history system that recorded a number of parameters about coupes/Compartments/Blocks/Silviculture/Logging History. This vital tool enabled the WFS to do spatial analysis that in this case turned out to be far superior to DNRE's own internal systems.

This work enabled the WFS to demonstrate that they had gone 7 hectares over the legal area allowed and that this coupe was illegal. The WFS, with community were on site and informing the logging contractor of our intention to blockade the coupe. The logging contractor stated openly that they believed the WFS's figures over the Departments and would refuse to log until it was sorted.

This campaign was written up by Dr Anitra Nelson in a forest history publication, cited elsewhere on this website. This demonstrated that taking a systematic intellectual approach to forest issues of the time could be more effective than non-evidence based direct action.

Loris' system allowed the data to be sorted in a number of ways to interrogate the data. The paged that follow are for the whole Wombat including the Bullarto POMA.

POSSIBLE.
ENCROACHMENTS ON 507 HA

SPECIAL PROTECTION ZONE - BULLARTO

	Ha's

- Sorting by this method identifies how much of each silvicultural system has occurred in each forest block.

- This should be correlated against Area of block available for harvesting

(not correct) ie. Blakeville = 12968 ha
= 8500 available for
ST = 1000
SH1 = 2500
SH2 = 1100

FURTHER FORMATTING

Seperat into Silvi system total for year subtotal for block.
